Luxembourg: Basic Facts (2011)

Inhabitants

512 000

Non-Nationals

43 %

Unemployment Rate

5.7 %

Basic Facts about the Greater Region (2011)

Inhabitants

11 417 000

Unemployment Rate

4.8 (RP)
- 10.4 (Lorraine)

Commuters

210 000

Center of the Greater Region: **Luxembourg**

Commuters

143 000

Active Population

225 000

**Domestic
Employment**

368 000

**Commuters
(% of Domestic
Employment)**

39 %

Why using LFS Data?

- Comparable Data on European level
- Appropriate Sample Size on regional level
- Complementary information to administrative sources
→ Study individual characteristics

Comparison of Commuters and Residents

STUDY

Comparison of **Commuters**

people living in one, working in another region -
professional mobility

and **Residents**

people living and working in one region

Descriptive Section and Logistic Regression Model

Specificities of Selected Approach

LFS: Resident Population Concept

→ Workplace Concept

Group 1: **Residents**

Group 2: **Commuters**

Descriptive Section: Variables

Selected variables	
Person's characteristics	sex age hatlevel national
Employment Situation	temp wishmore ftpt isco
Firm level	sizefirm nace

Some Findings - Descriptive Section

More stable working conditions for Commuters:

- Less limited contracts
- Less Part time contracts

But: Wish to work more

- Unsatisfied with their actual income ?

Logistic Regression

Logistic Regression:

Joint influence of certain characteristics on the likelihood to commute

Pooling of data over last 3 years

Each Region is studied separately

Predictor Variables	
Person's characteristics	sex age marstat national
Education	hatlevel
Profession	isco

Some Findings: Logistic Regression

Predictor Variables		Results (if significant)
Person's characteristics	sex	Males more likely to commute than females (all regions)
	age	35-44: Reference 25-34 negative effect for Lorraine 45-64 negative effect all Regions
	marstat	Positive effect for Wallonie
	national	Other Nationality: Reference Nationality as country of Residence, positive effect for Lorraine, Wallonie and Rheinland-Pfalz Nationality EU-15: positive for all regions

Some Findings: Logistic Regression

Predictor Variables		Results (if significant)
Education	hatlevel	Secondary: Reference Negative for Primary, Positive for Tertiary; All regions
Profession	isco	4 Categories- Reference 2 nd Findings vary across regions

Lessons Learned – Discussion (1)

Timeliness

- Timeliness of data

(Data Treatment in 10/2011 referring to 2009)

Lessons Learned - Discussion (2)

Access to Data - Pooling

- Access to Microdata: Eurostat-CD

Exception: German Microdata

Access ONLY by Forschungsdatenzentrum in Germany
or Eurostat in Luxembourg
(Administrative Procedure)

- Pooling of Data not possible

Lessons Learned – Discussion (3)

Weighting

- Small subsamples obtained from national datasets –
Appropriate to use national weights?

- Which weights to use in case of pooled datasets?

Thank you for your kind attention!

[- questions?]
